1 Opis problemu

Problem dotyczy sortowania zadań wykonywanych na wielu maszynach, w taki sposób, aby zostały zrealizowane w jak najkrótszym czasie.

Każde zadanie opisane jest parametrem P po jednym na każdą maszynę, gdzie:

• p - czas wykonania,

Każde zadanie musi być wykonywane nieprzerwanie i przejść kolejno po wszystkich maszynach. Na każdej maszynie zadania są wykonywane w tej samej kolejności.

2 Metoda rozwiązania

2.1 Calculate Cmax

Obliczanie czasu zakończenia wykonywania ostatniego zadania na ostatniej maszynie.

Listing 1: Calculate

```
unsigned int calculate(std::vector <machine> &container)
1
2
3
        const unsigned int machines = container.size(), tasks = container[0].p.size();
4
5
        for (auto &i : container)
6
7
            i.c.clear();
8
            i.s.clear();
9
        }
10
        for (unsigned int i = 0; i < machines; ++i)
11
12
13
            for (unsigned int j = 0; j < tasks; ++j)
14
                container[i].s.push_back(0);
15
                container[i].c.push_back(0);
16
17
18
        unsigned int startTime = NULL, endTime = NULL;
19
20
        for (unsigned int i = 0; i < tasks; ++i)
21
22
23
            if (i == 0)
24
            {
                startTime = 0;
25
26
27
            e1se
28
            {
29
                startTime = container[0].c[i - 1];
30
            endTime = startTime + container[0].p[i].value;
31
32
33
            container[0].s[i] = startTime;
```

```
34
            container[0].c[i] = endTime;
35
36
            for (unsigned int j = 1; j < machines; ++j)
37
38
                if (i == 0)
39
40
                    startTime = endTime;
41
42
                }
43
                e1se
44
                    startTime = std :: max(container[j].c[i - 1], container[j - 1].c[i]);
45
46
                endTime = startTime + container[j].p[i].value;
47
48
                container[j].s[i] = startTime;
49
50
                container[j].c[i] = endTime;
51
            }
52
       return container[machines - 1].c[tasks - 1];
53
54
```

2.2 Sortowanie nierosnąco według czasu wykonywania zadania na wszystkich maszynach

Listing 2: Algorytm sort

```
std::sort( priority.begin(), priority.end(), [](task a, task b)
{return a.value > b.value; });
```

2.3 Algorytm NEH

Algorytm NEH polega na pobieraniu po kolei każdego zadania z posortowanej listy, wstawieniu go pomiędzy już uszeregowane zadania i sprawdzeniu, dla którego miejsca w szeregu, daje on wynik najlepszy z możliwych. Ta procedura jest powtarzana do momentu uszeregowania wszystkich zadań.

Listing 3: NEH

```
int NEH( std :: vector <machine > &container )
1
2
   {
3
        std::vector <task> priority;
4
5
        for (int i = 0; i < container[0].p.size(); ++i)
6
            task temp = { static_cast < unsigned int >(0), i };
7
8
            priority . push_back(temp);
9
        }
10
11
        for (int i = 0; i < container.size(); ++i)
12
13
            for (int j = 0; j < container[0].p.size(); ++j)
14
                priority[j].value += container[i].p[j].value;
15
16
            }
17
        }
18
19
        std::sort(priority.begin(), priority.end(), [](task a, task b) {return a.value > b.v
20
21
        std::vector <machine> sorted;
22
23
        for (int i = 0; i < container.size(); ++i)
24
25
            machine temp;
26
            sorted . push_back(temp);
            for (int j = 0; j < container[0].p.size(); ++j)
27
28
29
                task temp2 = container[i].p[priority[j].index];
30
                sorted[i].p.push_back(temp2);
31
            }
32
        }
33
34
        std::vector <std::vector <machine>> table;
35
        std::vector <machine> toRemember;
```

```
36
37
        for (int i = 0; i < sorted.size(); ++i)
38
39
            machine temp;
            toRemember.push_back(temp);
40
41
            task temp2 = sorted[i].p[0];
42
            toRemember[i].p.push_back(temp2);
43
        }
44
45
        for (int i = 0; i < sorted.size(); ++i)
46
47
            sorted[i].p.erase(sorted[i].p.begin());
48
        }
49
50
        int ind = NULL;
51
        while (! sorted[0].p.empty())
52

58
59
60
                for (int j = 0; j < toRemember.size(); ++j)
61
                     table[i][j].p.insert(table[i][j].p.begin() + i, sorted[j].p[0]);
62
63
                }
64
            }
65
            for (int i = 0; i < sorted.size(); ++i)
66
67
                sorted[i].p.erase(sorted[i].p.begin());
68
69
70
71
            int value = INT MAX;
72
            for (int i = 0; i < table.size(); ++i) {
73
74
                int temp = calculate(table[i]);
75
                if (temp < value) {</pre>
76
                     value = temp;
77
                     ind = i;
78
                }
79
            }
80
81
            toRemember = table[ind];
82
            table.clear();
83
84
        return calculate(toRemember);
85
```

2.4 NEH Plus

Algorytm NEH Plus to zmodyfikowany algorytm NEH. Po dodaniu kolejnego zadania w najlepsze miejsce wybiera inne, już posortowane zadanie i tak jak poprzednio, wstawiając je między inne uszeregowane już zadania, wybiera pozycję która daje najlepszy wynik.

Wybierane zadanie to takie, którego usunięcie spowoduję największe zmniejszenie wartości Cmax.

Listing 4: NEH Plus

```
int NEHPlus(std::vector <machine> &container)
1
2
   {
3
        std::vector <task> priority;
4
5
        for (int i = 0; i < container[0].p.size(); ++i)
6
7
            task temp = \{ 0, i \};
8
            priority . push_back(temp);
9
       }
10
        for (int i = 0; i < container.size(); ++i)
11
12
13
            for (int j = 0; j < container[0].p.size(); ++j)
14
15
                priority[j].value += container[i].p[j].value;
16
17
        }
18

142
143
                 }
```

3 Eksperymenty obliczeniowe

Obliczenia zastały wykonane na komputerze klasy PC z procesorem i7-4702HQ, kartą graficzną NVIDIA GeForce GTX 850m, 16GB RAM i dyskiem SSD. Jako miarę jakości algorytmu przyjęto średnie procentowe odchylenie (Percentage Relative Deviation, PRD) najlepszego otrzymanego rozwiązania π względem rozwiązania referencyjnego π^{ref} :

$$PRD(\pi) = 100\% (C_{max}(\pi) - C_{max}(\pi^{ref})) / C_{max}(\pi^{ref})$$

Rysunek 1: Cmax wykonywania się algorytmów w zależności od ilości maszyn

Rysunek 2: Czas wykonywania się algorytmów w zależności od ilości maszyn

Rysunek 3: Cmax wykonywania się algorytmów w zależności od ilości zadań dla 20 maszy

Rysunek 4: Czas wykonywania się algorytmów w zależności od ilości zadań dla 20 maszy

4 Wnioski

Algorytmy *NEH* i *NEHPlus* dają podobne wyniki, *aleNEHPlus* wykonywany jest znacznie dłużej ze względu na wyższą złożoność obliczeniową.
